

Computer Virus Alert: Protect Your Data

written by Chandradip News24 | December 5, 2024

Computer viruses are malicious software programs that can harm your computer system, steal your data, and spread to other devices. They often come in the form of email attachments, instant messages, or files downloaded from the internet. It is crucial to stay vigilant and take steps to protect your system from these threats. Regular updates, strong passwords, and reliable antivirus software are essential for maintaining your digital security.

How to Prevent Computer Viruses:

1. **Use Antivirus Software:** Install and keep your antivirus software up-to-date. It will scan your system for viruses and remove them if found.

2. **Be Cautious with Email Attachments:** Do not open attachments from unknown senders or suspicious sources. If you receive an unexpected attachment, delete it without opening it.

3. **Regular Updates:** Keep your operating system and applications updated. Updates often include security patches that protect against known vulnerabilities.
