Computer viruses are malicious software programs that can replicate themselves and spread to other computers. They can cause a variety of problems, including data loss, system crashes, and unauthorized access to your information. It's important to take steps to protect your devices and information. This includes keeping your operating system and software up to date, using antivirus software, and being cautious when downloading files or clicking on links. If you suspect your device is infected, you should disconnect it from the internet and seek professional help.

Prevention Tips:

1. Keep your operating system and software up to date: Regular updates often include security patches that address known vulnerabilities.

2. Use antivirus software: Antivirus software can detect and remove viruses before they can cause damage.

3. Be cautious when downloading files or clicking on links: Only download files from trusted sources and avoid clicking on suspicious links.
