

Computer Virus Alert: Protect Your Data

written by Chandradip News24 | December 5, 2024

Computer viruses are malicious software programs that can damage your system, steal your data, and spread to other devices. It's essential to stay informed about the latest threats and how to protect yourself. Regular updates, strong passwords, and reliable antivirus software are key to staying safe. If you suspect an infection, act quickly to isolate the device and seek professional help.

How to Identify a Virus:

Common signs include slow performance, frequent crashes, and unusual network activity. If you notice these symptoms, run a full system scan immediately.

Prevention is the best defense. Use reputable antivirus software, avoid downloading files from untrusted sources, and keep your operating system updated.
