

WhatsApp 'Two-Factor Authentication' Feature

written by Chandradip News24 | January 1, 2025

WhatsApp has introduced a new security feature called 'Two-Factor Authentication' (2FA) to enhance user account security. This feature allows users to add an additional layer of protection to their accounts by linking them to a secondary phone number. This secondary number is used to verify the user's identity during the login process, ensuring that only the legitimate user can access their account. The feature is available to all users and can be enabled through the app's settings.

WhatsApp 'Two-Factor Authentication' Feature

This new feature is designed to protect users' accounts from unauthorized access, particularly in cases where a user's primary phone number is compromised or stolen. By enabling 2FA, users can significantly reduce the risk of their accounts being hijacked. The feature works by sending a verification code to the user's secondary phone number, which they must enter along with their password to log in. WhatsApp (2FA) is a security feature that allows users to add an additional layer of protection to their accounts by linking them to a secondary phone number. This secondary number is used to verify the user's identity during the login process, ensuring that only the legitimate user can access their account. The feature is available to all users and can be enabled through the app's settings.
